

Course program and reading list

Semester 1 Year 2024

School: Arison School of Business B.A

analysis of social networks

Lecturer:

Dr. Moses Miller moses.miller@runi.ac.il

Teaching Assistant:

Mr. Yuval Yosef yuval.yosef@post.runi.ac.il

Course No.:	Course Type :	Weekly Hours :	Credit:
3873	Lecture	2	2

Course Requirements :	Group Code :	Language:
Final Paper	241387300	Hebrew

Prerequisites

Prerequisite:

1528 - statistical methods and data analysis II
1905 - machine learning methods I

 Course Description

"Because of our tendency to want what others want, and because of our inclination to see the choices of others as an efficient way to understand the world, our social networks can magnify what starts as an essentially random variation."

— Nicholas A. Christakis

Course Overview:

This course delves into the increasingly recognized role of social networking platforms, such as Facebook and Twitter, in the business world. It acknowledges the growing realization that people's decision-making processes are heavily influenced by the information they garner from others, through both direct communication and observation of behavior. In recent times, a notable number of successful ventures by Israeli firms have been rooted in the power of interpersonal social connections. Social Network Analysis, an interdisciplinary field encompassing Marketing, Computer Science, Psychology, and Sociology, offers insights into the formation, characteristics, and business implications of social influence.

The course has a dual objective. Firstly, it aims to impart a comprehensive understanding of both the theoretical underpinnings and the technical methodologies involved in analyzing social networks. This includes data collection, storage, visualization, and the interpretation of networks' statistical properties. Secondly, the course seeks to explore the business dimensions of social networks. This exploration covers a range of topics, including the mapping of various network types and forms of social influence, understanding consumer behavior and its susceptibility to influence by others, the genesis of trends and new market segments, and the dissemination of information or products across networks.

We will also examine innovative business models that companies employ to engage with and leverage social influences among consumers. Furthermore, the course will delve into emerging technological trends and the influence of a hyper-connected world on innovation and technology. This comprehensive approach aims to equip students with both a deep understanding of social network dynamics and practical insights into their application in a business context.

Course Goals

Course Objectives:

This course aims to endow students with a comprehensive understanding of social networks from a theoretical standpoint, emphasizing the integration of academic research findings within the realms of business and marketing. A significant focus will be placed on equipping students with practical skills in Social Network Analysis (SNA), encompassing both the methodologies and the software tools necessary for effective analysis.

Highlighted Topics of the Course:

1. **Exploring the Connected World:** An introductory overview of the digital interconnectedness shaping our society.
2. **Business Applications of Connectivity:** Examining how businesses leverage the connected world for strategic advantage.

3. **Impact of Mobile Connectivity:** Understanding the significance of real-time location data and its continuous flow in decision-making processes.
4. **Diversity in Social Networks:** An exploration of various types of social networks and their unique characteristics.
5. **Behavioral Influence of Social Networks:** Investigating how social networks mold individual and group behaviors.
6. **Technical Tools for Social Network Analysis:** Practical training in the use of specialized software and programming tools for analyzing social network data.
7. **Information Dynamics in Social Networks:** Studying the patterns and pathways of information dissemination within networks.
8. **Machine Learning Applications in Social Networks:** Delving into the integration of machine learning techniques in the analysis and understanding of social network dynamics.

Each topic is designed to provide a thorough understanding of both the theoretical and practical aspects of social networks, ensuring students are well-equipped to apply these concepts in various professional settings.

Grading

Course Evaluation Criteria:

Final Project Requirement: Achieving a passing grade on the final project is mandatory to pass this course. This significant project shows your comprehensive understanding and application of the course material.

Submission Guidelines and Deadlines: All coursework must be submitted via Moodle by the specified deadlines. Just so you know, late submissions will incur a penalty in terms of credit reduction and, in some cases, may not be accepted.

Assessment Breakdown:

1. **Homework Assignments (Group Submission) - 40% of Final Grade:**
 - Assignments will be assigned throughout the course, focusing on various topics covered.
 - All homework must be completed in Groups (no more than three students in a group) and submitted through Moodle.
2. **Final Project Deliverable (Group Submission) - 20% of Final Grade:**
 - This aspect involves applying the concepts and techniques learned to a practical project, showcasing your programming abilities in demonstrating course concepts on an applied problem.
 - You will define the project's scope and desired outcomes. Specific guidelines will be provided during the course.
 - The deliverable, in the form of a PDF document, must be submitted on Moodle.

3. Final Project Defense (Individual via Zoom) - 40% of Final Grade:

- Following submitting your final project deliverable, you will arrange a Zoom meeting with the course staff.
 - During this session, you will present a defense of your project, explaining your approach and answering questions related to your work and the course content.
